Panbonis®
The unique natural source of the bioactive form of vitamin D

Supports the essential functions of vitamin D
100% natural and readily available to the body
Increases calcium and phosphorus utilisation in feed
An economical and safe complementary feed

Herbonis – Synonym for healthy bones
Panbonis® is a formulated, processed and standardized product containing the plant Solanum glaucophyllum, which naturally contains 1,25-dihydroxycholecalciferol-glycosides. Following uptake, Panbonis® releases the right amount of the active form during intestinal passage. This supports the intestinal uptake of calcium and phosphorus from feed into the body circulation and can also be helpful under field conditions or when feed components are not optimal.

The unique herbal product Panbonis® acts fast. It delivers a dosed amount of the active form directly to the intestinal track without being activated by liver and kidney. Afterwards, it is rapidly excreted without accumulation in tissue. In addition to these benefits, there are as well economic advantages as well as saving up to 20% phosphorus addition in feed and shows increased growth performance and bone mineralization.

The product is a complementary feed according to EC 767/2009 regulation and available in two concentrations, Panbonis® 10 ppm and Panbonis® 20 ppm. It should be used on top of recommended vitamin D₃ supplementation from other sources.

Feedback from our customers:

- “improves the end weight on a given day”
- “reduced condemnations”
- “reduced losses in slaughter house due to broken bones”
- “Herbonis endeavors to make a significant contribution to animal welfare with biologically active natural compounds”
